

Name: Magdalena Dörögrip

Age: 21

Country: Sweden

Name of the Organization:  
IPOPI

### About my Organization:

IPOPI is the International Patient Organisation for Primary Immunodeficiencies that was established in 1992 in Switzerland.

Ever since IPOPI was created the main goal has always been to improve awareness, get access to early diagnosis and also to get the best possible treatment for PID patients worldwide.

### About me:

I had a pretty normal childhood and lived my life as a normal kid. But I would often get strange infections that never really seemed to be an infection. At the age of 14 I was incorrectly diagnosed with Asthma, but after a year, my breathing got worse and I was then diagnosed with CVID. The difficulties with breathing was due to untreated infections, which led to the development of bronchiectasis in my lungs.

My bronchiectasis has really been my motivation to spread awareness about primary Immunodeficiencies. Early diagnosis and treatment is so important in preventing these lungdamages to get as good of a life quality as possible.

I am also really interested in the genetics behind genetic conditions and different treatments. This interest has led me to study the masters engineering program in Biotechnology.
